

ABSTRACT

In an information processor which records many contents or has many contents already recorded therein, and can generate an arbitrary combination of the contents, a weight is computed for each of the contents based on either data stored in a history data file (184) or data stored in a display data file (182) and data stored in a filtering data file (181), and a content is selected from the contents stored in a content file (161) based on the weight. The selected content is related with a package corresponding to the data stored in the filtering data file (181).
